No ANSI stuff to deal with - colors are specified by name. It is based on a class library called dlabels.lib that is distributed with dlabels.exe (dlabels.zip). WBAT is tested with DOSbox. ## What's New In?

You can use WBAT to change the colors of the interactive windows. There is one (1) INI file to set the default colors and a single configuration file named WBAT.INI which includes all the actual color settings. You can choose to save your settings to WBAT.INI to return them at any time. Or you can change colors on the fly and stay with them for as long as WBAT.EXE is running. WBAT has several interesting features which help make it a useful utility: - It handles all the display modes - no matter what the window is, you can change it. - The color settings are saved for you. - The same color settings can be used for dialog boxes, windows (full screen and plain text), icons, or even in a terminal, but only to change the color of dialog boxes. Application Features: - Save your colors to WBAT.INI for later use. - Choose from a set of predefined colors. - Chose from a set of predefined color combinations. - A comprehensive help system. - Advanced features such as an advanced option for window transparency, an advanced option for the text display, color cycles, and many more. - WBAT can be run as a GUI DOS batch file. - WBAT can be run in full screen mode, or the window can be placed in the DOS window. - You can define the size of the WBAT window and the text size. - The text can be set to be italic, bold, or underlined, and can be set to be monospaced or multiline. - You can have WBAT run in the background or foreground (it is smart enough to determine this). - You can change the colors of the main WBAT window (the one which displays the name of the batch file you are working on). Installation: - To install, you simply extract WBAT.EXE to your \WBAT directory (remember to make a backup first). - To run WBAT, you simply type WBAT at the DOS prompt. Compiling: WBAT does not come with any source code. To change the colors, you must first create a WBAT.C file with the desired colors. You can do this by saving the WBAT.EXE source code and changing the colors by hand or by using any source code editor. It can be any source code editor you choose - you can even use something like Notepad++ for Windows. The WBAT.C file must be compiled before you can use the new colors. A WBAT.EXE compiler is included in the WBAT distribution, but it only uses the text file you use in the WBAT.EXE source code. To compile, use the
